

	- Considering market access, value chain and demand of the forestry product as well as transportation and storage facilities. - Strategic planting arrangement and spacing to avoid overcrowding and to allow each layer to receive necessary light, water and nutrients. - Rainwater harvesting and irrigation planning to ensure optimum level of water for different types of plant species and to avoid waterlogging.			
Operation and maintenance	Managing the soil nutrient and water demand between trees and crops as well as regular pruning and thinning is labor-intensive and requires proper knowledge of tree species and growth patterns.			
Cost	High			
Benefits				
	Type	Low	Medium	High
	Canopy Cover Increase			
	Carbon Sequestration			
	Crop Production Increase			
	Crop Failure Risk Reduction			
	Ensuring Food Security			
	Fruit Production Increase			
	Forestry Goods Production Increase			
	Livestock Production Increase			
	Fisheries Production Increase			
	Alternative Livelihood Generation			
	Increase of Income			
	Soil Erosion Control			
	Improved Soil Health			
	Soil Fertility Increase			
	Sustainable Water Supply			
	Water Quality Improvement			
	Water Purification			
	River Bank Erosion Control			
	Surface Runoff Reduction			
	Groundwater Recharge			
	Pest and Disease Management			
	Reduction of Pesticides and Fertilizer Use			
	Ecosystem and Biodiversity Increase			
	Better Communications			
	Better Education			
	Better WASH facilities			
Implementation Challenges				
	Type	Low	Medium	High

	Land unavailable/high land area required			
	Supply chain disconnection			
	Land right related problems			
	High human investment capital need			
	Insufficient infrastructures			
	Less demand of agroforestry product			
	Environmentally unsustainable			
	Socially unacceptable			
	Less beneficial			
Environmental performance	• The layered structure helps retain soil moisture by reducing surface evaporation and promoting better water infiltration. • MSFG reduces the spread of pests and diseases by promoting biodiversity and encouraging the presence of natural pest predators. • The integration of various plant roots at different levels helps improve soil structure, reduce erosion, and increase organic matter. • Combining different layers of crops maximizes the productivity of a given piece of land, producing a variety of fruits year-round. • By incorporating a variety of plant species, MSFG helps reduce the risks of crop failure due to changing climate conditions, such as droughts or heavy rains.			
Remarks	This measure will aid landscape restoration in the CHTs as well as improve agroforestry production and improve livelihood.
