

ANNEX A: CONCEPT NOTE OF THE CONSERVATION MEASURES

This Annex contains detail concept note on conservation measures. Which outlines brief description about the measure, its site suitability, slope suitability, probable design consideration, and its feasibility along with benefits and implementation challenges.

Below figure shows different symbology used within the concept notes.

F-1. Enrichment Plantation with Native/Indigenous Species

Descriptions

[illegible]

	- Optimizes tree spacing and survival rates. Environmental Feasibility - Prevents erosion and land degradation through sustainable water flow management. - Maintains ecological balance by minimizing habitat disruption. - Restores native flora and fauna habitats. Economic Feasibility - Uses locally available seedlings and community labor. - Generates income through agroforestry, medicinal plants, and non-timber forest products. - Improves land productivity, reduces climate risks, and enhances local economies Social Feasibility - Engages local farmers in planning, implementation, and maintenance. - Enhances food security and economic opportunities. - Aligns with government policies and local governance structures for long-term sustainability.			
Operation and maintenance	Routine Monitoring & Maintenance – Ensures seedling survival, weed control, and replanting as needed. Soil & Water Management – Implements mulching, composting, and water retention strategies. Fire & Pest Protection – Prevents Forest fires, invasive species, and disease outbreaks. Community-Based Oversight – Establishes Forest user groups for long-term management			
Cost	High			
Benefits				
	Type	Low	Medium	High
	Canopy Cover Increase			
	Carbon Sequestration			
	Crop Production Increase			
	Crop Failure Risk Reduction			
	Ensuring Food Security			
	Fruit Production Increase			
	Forestry Goods Production Increase			
	Livestock Production Increase			
	Fisheries Production Increase			
	Alternative Livelihood Generation			
	Increase of Income			
	Soil Erosion Control			
	Improved Soil Health			
	Soil Fertility Increase			
	Sustainable Water Supply			

	Water Quality Improvement			
	Water Purification			
	River Bank Erosion Control			
	Surface Runoff Reduction			
	Groundwater Recharge			
	Pest and Disease Management			
	Reduction of Pesticides and Fertilizer Use			
	Ecosystem and Biodiversity Increase			
	Better Communications			
	Better Education			
	Better WASH facilities			
Implementation Challenges				
	Type	Low	Medium	High
	Land unavailable/high land area required			
	Supply chain disconnection			
	Land right related problems			
	High human investment capital need			
	Insufficient infrastructures			
	Less demand of agroforestry product			
	Environmentally unsustainable			
	Socially unacceptable			
	Less beneficial			
Environmental performance	• Soil Erosion Prevention – Strengthens land stability through deep-rooted native species. • Carbon Sequestration & Climate Resilience – Increases Forest cover, absorbing CO₂ and reducing climate impacts. • Water Conservation – Enhances rainwater absorption and groundwater recharge. • Habitat Restoration – Supports wildlife corridors and natural ecosystem recovery.			
Remarks	Implementing effective enrichment plantations in the CHT demands species selection matched to local topography and soil conditions. Community-led management, involving indigenous groups, fosters enduring ownership and stewardship. Enrichment initiatives must align with broader conservation goals, including watershed management and reforestation programs, to achieve landscape-level impact. Robust policy and institutional backing, involving government forestry agencies and NGOs, ensures funding, technical expertise, and enduring success. Through scientifically grounded methods, participatory approaches, unwavering commitment, and strong cooperation, these efforts will restore forest ecosystems, boost biodiversity, enhance environmental resilience, and support local livelihoods, creating sustainable and continuous outcomes for generations to come.
